SCI-NOI v0.1 r0.4 Engineering Conformance Specification

Implementation-blind Stage B draft

Scientific owner: Grant Wilson

SCI-NOI_ENGINEERING_CONFORMANCE v0.1/draft-r0.4

Not frozen. No implementation conformity, validation, calibration, physical-noise, covariance-completeness, significance, performance, readiness, or production claim.

SCI-NOI v0.1 r0.4 Engineering Conformance Specification

Document identity: SCI-NOI_ENGINEERING_CONFORMANCE v0.1/draft-r0.4

Scientific owner: Grant Wilson

Date: 2026-08-30

Status: implementation-blind proposed final Stage B draft; scientifically freezeable conditional; not frozen.

Normative authority: the six ordered modules in SCI-NOI_NORMATIVE_MODULE_BINDING v0.1/r0.4, binding-file SHA-256 5c6de3bd5180c9231c79cabe5f5918938571340a9f836f437962779e0410d55a. This ECS supplies prospective evidence procedures only and authors no science.

1. Evidence identity and result vocabulary

Every result shall identify exact product, method, parent, observation, TolTEC array, plan, generation, lifecycle, and named use. Review compares serialized scientific identities and typed states, never filenames, shapes, generic flags, approximate WCS, or undocumented defaults.

Every gate shall report one of pass, fail, unavailable, or not applicable with exact cause. Method identity, source closure, plan resolution, numerical realization, response-bearing realization, empirical calibration, implementation conformity, validation, and production authorization shall be reported separately.

2. Ordinary operator and immutable-parent evidence

Evidence shall expose retained PTC occurrence, detector/network, coefficient family/value/QC, canonical rational coefficient, projection contribution, unsigned denominator, numerical coverage_cut, WCS/support, response, assignment, and application count. It shall demonstrate one sign occurrence only on Z_i^{PTC} and no changed MAP gate. A required response companion shall use identical membership and sign exactly once.

The all-+1 arithmetic shall be compared only to an independently governed, scientifically realized ordinary SCI-MAP product. Missing coefficient, coverage_cut, MAP admission, response, profile authority, or other parent fact shall make the dependent route unavailable.

3. Cardinality and universal design evidence

A disabled fixture shall have $N_{\text{requested}}=0$, no design identity, no member, no successful ensemble, no UNC, and no STD. An enabled-success fixture shall have positive integer request and exact equality $N_{\text{resolved}}=N_{\text{requested}}>0$. An enabled-failure fixture shall fail the complete design when one required member exhausts its cap and shall publish no smaller successful resolved ensemble. Rejected candidates shall appear only in design- construction evidence.

Every design record shall include exact law or finite measure; stable population/order; alphabet; probabilities/weights; equality, duplicate, complement, and equivalence relations; all counts; applicable ranks/null spaces; deterministic reconstruction; lifecycle, generation, completion, and failure; and preregistration of every applicable field. Unused fields shall be not_applicable.

4. Exact balance-arithmetic evidence

Every persisted a_{π} and τ_h shall serialize as canonical ASCII n/q . Evidence shall reject nonpositive denominators, unreduced pairs, noncanonical zero, nonpositive active mass, and thresholds outside $[0,1)$. Exact rational accumulation in stable identity order shall reproduce every β_d , imbalance numerator, total, and admitted-set membership. Admission shall be reproduced by integer cross multiplication, with no floating comparison, epsilon, tolerance relaxation, or best-failed selection.

The following boundary fixtures are mandatory:

- Fixture | Exact L_h | Exact T_h | Exact τ_h | Required decision
- Equality | $1/10$ | $1/1$ | $1/10$ | admit, because equality is included
- One rational step above | $10000000000000001/10000000000000000$ | $1/1$ | $1/10$ | reject
- One rational step below | $9999999999999999/10000000000000000$ | $1/1$ | $1/10$ | admit

The second fixture is deliberately close enough that a finite floating conversion can collapse it onto the equality value; exact arithmetic must keep the opposite decisions. A reordered-accumulation fixture with widely separated rational magnitudes shall reproduce identical canonical totals and membership.

5. Selected rejection law and keying evidence

Evidence shall enumerate complete and active populations, zero-mass facts, zero-total not_applicable strata, unavailable ambiguous positive-mass membership, and unavailable singleton active strata. It shall reproduce exact thresholds, independent symmetric base candidates, first-accepted search, positive cap, fail-closed exhaustion, replacement, separate duplicate/orbit relations, equal $1/N$ resolved weights, and uncentered r_{sign} .

The plan shall bind generator identity and version, opaque seed/key bytes, namespace, canonical serialization, observation, array, stratum, member, candidate-attempt counter, stable detector order, and counter-domain separation. Replays varying scheduling, process and worker counts, traversal, container layout, and persistence mode shall yield identical assignments.

An exact enumeration or analytic proof shall establish conditional uniformity: for each admitted vector x , the probability that trial k is the first accepted vector and equals x is $(1-q)^{(k-1)} p$, where common candidate probability p is identical for every admitted vector and q is total admission probability. Summing over the cap supplies the same factor for every x ; normalization is uniform. Separate member and stratum streams shall support the complete conditional joint law $\epsilon_b \text{ iid } \sim \text{Uniform}(A)$.

6. Completion, UNC membership, and information evidence

Evidence shall distinguish candidate rejection, member failure, scientific replacement, and idempotent execution retry. A retry retaining scientific identity shall prove identical work and distinct I_{attempt} . Persistence evidence shall prove exact reconstruction, regeneration, sufficiency, lost questions, lifecycle, completion, and failure semantics for the selected mode.

Initial UNC shall prove set equality $A_{\text{UNC}}=B_{\text{resolved}}$ and count equality

$N_{\text{admitted}}=N_{\text{completed}}=N_{\text{resolved}}=N_{\text{requested}}>0$. Every resolved member shall have a positive exact member decision and belong to one common domain. A fixture in which every member completes but one is UNC-ineligible shall produce an unavailable complete estimator and no subset, renormalization, or changed divisor.

Estimator reproduction shall use the exact known-zero-center formula with divisor N_{resolved} , no finite-ensemble centering, and no B-1. The exact primary product name and target-law variance consequence shall remain separate. Counts, duplicates, complement orbits, r_{sign} , r_{map} , estimator uncertainty, and effective information shall be independently reported. An effective- information result shall state estimator, target, domain, dependence model, and calculation or be unavailable.

7. Reciprocal, STD, and response evidence

No reciprocal ordinary-base evidence is presently evaluable. A future route requires exact owner disposition, finite-positive parent domain, separate method/profile/use, and no role promotion.

STD evidence shall bind independently realized m_MAP and compatible $Vhat_cond$, reproduce $\sigma_cond = \sqrt{Vhat_cond}$ and ζ_cond , verify unit 1, and emit only the bounded claim. It shall carry numerator/scale dependence, support intersection, response state, and cause, with no interpolation, extension, implicit reciprocal, JINC substitution, or significance language.

Response fixtures shall distinguish:

1. scale explicitly held fixed, reproducing only $\delta \zeta_{fixed_scale} = \text{diag}(1/\sigma_cond) \delta m_MAP$; and
2. scale responding, reproducing the additional $-m_MAP \delta Vhat_cond / (2 \sigma_cond^3)$ term.

Without separately authorized $\delta Vhat_cond$, the full STD procedure response shall report unavailable. Dividing MAP response by σ_cond shall not pass a full-response gate.

8. Profile, source, and parity evidence

Evidence shall preserve request, applicability, eligibility, and realization as separate fields. The four immutable r0.18 profiles shall reproduce their exact block digests and Registry/source bindings. Each changed r0.4 use shall bind the exact complete @2 bytes, owner approval, and successor Registry/source record before evaluation. A proposed name or old profile shall not pass the changed-action gate; missing authority yields unavailable, not numerical ineligibility or a successful empty product.

REQUIREMENT_PREDICTION_OWNER_TRACEABILITY.csv supplies one row per stable requirement with exact owner source, predictions, dependencies, and review kind. Future review shall report every row. This draft supplies no current implementation conformity, validation, calibration, performance, readiness, freeze, or production result.
